

Birch Plywood

Better plywood, better performance... better forms!

The best concrete appearance comes from using the best form face. That's why we've chosen birch plywood as the standard face for the SurePly™ Forming System.

Using 100% birch plywood in SurePly panels and fillers provides exceptional performance and appearance, including:

- The birch wood has a tight grain structure, exhibiting greater strength than fir plywood, while resisting moisture absorption.
- A multi-ply manufacturing process provides strength and uniform flatness by using long and short grain directional veneers.
- The top two layers of each face are inspected, patched and smoothed, eliminating surface degradation from underlying veneer collapse.
- The 220/220 phenolic overlay, both front and back, prevents moisture absorption, eliminates grain transfer, and extends useful life.
- After being cut-to-size for panel and fillers, any exposed plywood edges are sealed to minimize water penetration.

Of course, the SurePly Forming System should be treated with form release before concrete placement to maximize form life and reduce cleaning.

Long-lasting 9-ply birch plywood is the standard form face for SurePly panels and fillers.
